PSYCHOLOGICAL APPROACHES OF THE EDUCATIONAL EDUCATOR OF PRESCHOOL EDUCATIONAL INSTITUTIONS
Annotation
This scientific article highlights the psychological knowledge of teachers of preschool educational institutions, psychological approaches in their relationships with children.
Key words: Teacher-teacher, child’s personality, psychological knowledge, trajectory, psychological support

Introduction. In this day and age, the problem of training modern teachers and educators is relevant in the processes of modernization of preschool education. The formation of a future member of society begins with kindergarten and teacher. This is why it is honorable and vitally important to be a kindergarten teacher. A modern educator in preschool educational institutions also needs psychological competence and knowledge, manners, love for children, pedagogical skills, and creativity.

Unit 11 of the Law of the Republic of Uzbekistan “About Education” states that: “Preschool education has the goals of forming a healthy and mature personality of the child, prepared for school. This education is conducted in the family, kindergarten and other educational institutions, regardless of the form of ownership, until the age of six or seven.” In fact, it is essential to enhance the preschool education system, ensure that educators properly organize the educational process of the mature generation, and effectively organize the professional skills of educators and the process of improving their qualifications.

The work on radical reform of preschool educational institutions assigns responsible tasks to educators. According to the requirements of our time, a teacher-educator is required to be morally and spiritually mature, socially active, have a passion for creative activity, a new professional outlook, and the ability to adapt to the requirements of changing times. In the process of upbringing, children develop not only rules and norms of behavior, but also all the positive qualities of speech and thinking. To do this, the teacher must have pedagogical skills and psychological knowledge. Pedagogical skill helps to effectively carry out educational work that realizes the upbringing of a person, depending on their age, they will try to organize their attitude and different games, understanding child psychology.

Preschool education plays an important role in shaping a child's future personality and preparing them for success. At the moment, a kindergarten teacher is required to have a high level of professional skills and psychological competence. One of the main problems is the lack of qualified teachers, and another one is the lack of a unified psychological and methodological base and standards for preschool educational institutions. We need to introduce teaching aids that provide psychological support to teachers working in preschool educational institutions, as well as pedagogical technologies which is enriched with innovations.
Moreover, it is appropriate to introduce an individual educational trajectory in raising a child with a modern kindergarten teacher. There is a need to introduce psychological service programs that include our national values related to the processes of a child’s lifelong education. Teachers working in preschool educational institutions are busy with such things as caring for the health and well-being of children, maintaining psychological records and documents studying children, and planning future work. The work of a teacher in preschool educational institutions is an activity that requires constant work on oneself, creative thinking and research work. Today, educators have high demands from the parents of children and the general public; they must provide a good education, have personal and professional qualities, competent speech and decent appearance as a teacher, as well as, knowledge, skills and abilities.

In a preschool educational institution, the teacher must have grammatically correct speech, since at that age when the child’s vocabulary is just being formed, but is growing very quickly, the surrounding language environment must be morally correct, clear and so on. The teacher’s speech should be simple and understandable to the child, but at the same time clear and logical. Enriching a child’s speech vocabulary cannot remain without the attention of the teacher.

The main person who can influence the upbringing of a child in kindergarten is the teacher. A teacher-educator is a professional who loves his profession, is friendly towards children and carries out activities that influence the mental development of the child. However, the role of the kindergarten teacher is underestimated, since his influence on the child is not always easy. In preschool age, the development of a child as a person begins in kindergarten.

In fact, the psychology of the educator-teacher manifests itself, is formed and changes in the process of his pedagogical activity. The professional goal of teaching is to educate the younger generation. The activities of preschool educational institutions have their own forms of organization, content and methods of implementation. The content and psychology of pedagogical activity in preschool educational institutions, firstly, social factors - the role and functions of the kindergarten teacher in society, society's requirements for the teacher, then sociopsychological factors, the teacher is determined with the help of the social expectations of the people around him.

We know that the humanization of the education system, which characterizes the current stage of its development, places high demands on the general and professional training of teaching staff and the manifestation of their creative individuality. Individual style of activity is one of the important features of the process of individualization of professional activity. Preschool educational activity is complex and multicomponent, and its components are also diverse. Kindergarten requires methodical approaches to life.

The main task of a kindergarten teacher is to provide standard conditions for mental development, correct conditions that have a negative impact on the child’s behavior, quickly identify deviations in the process of mental development, it is pivotal to predict further development, carry out the necessary prevention of possible problems of mental development, perhaps even seek help from a specialist - a psychologist. In addition, knowledge about the child’s psyche should be determined by integrity, universality and systematicity; and it is crucial to understand the relationship between individual areas of development of the child’s psyche, forms of its activity, mental characteristics and processes, as well as abilities and motives. Kindergarten teachers are required to pay practical attention to studying children, understanding their behavior, determining their inclinations, and creating conditions for their development.
Conclusion. It should be said that preschool educational institutions require a responsible psychological approach from educators. It is desirable to improve efforts to provide teachers with psychological knowledge and psychological teaching aids.
